Abstract of DE19807328

The invention relates to an electromagnetically actuated disk brake, comprising a housing (12) and a brake lining (14) which is impinged upon by an electrically actuated actuator which comprises an electric motor (20) and a spindle/nut gear system. The invention is characterized in that the electric motor (20) is configured as an internal-rotor motor with a stator (22) and a rotor (26), where the rotor is coupled to the spindle (36) in a non-rotating manner, in that the spindle (36) is coupled to the nut (42) in a kinematic manner so as to transmit a rotation of the spindle (36) into a translatory movement of the nut (42), in that the spindle (36) in its longitudinal direction is mounted in at least two points such that it can rotate in relation to the housing (12) and in that the nut (42) is guided in relation to the housing (12) in an axially sliding manner.
